

Server Replicator

Most IT technicians recommend tape backup but why?

It's slow, unreliable and requires human intervention. Should your server fail restoring from total drive failure can take hours if not days.

Server Replicator provides an extreme backup process which takes a time-based image of a hard drive at a given point; this image can be used to entirely replace the hard drive in a matter of minutes. Server Replicator reduces the downtime for installing server software again as it's already setup!

By further reducing setup time, program installation or any other configuration time, it can significantly reduce the downtime and loss of income your business would have experienced should your server suffer hard drive failure.

Server Replicator could save you thousands, including you business.
